Hello,

OUR CAMERA MOUNT IS NOW GYRO-STABILIZED.

We are pleased to inform you that we have made a major advancement in our aerial photogrammetry technology. We have completed the enhancement of our Piper Navajo's camera mount by gyro-stabilizing it. Bench tests have been successfully completed and the unit will enter service as soon as our photo season starts.

This means that our control of pitch and roll should be much better than in the past, and our drift removal should improve significantly. This should ease your workload considerably.

One unique benefit of our new system is that, should the auto-leveling function fail (it is complex and delicate), we will be able to revert to our original joystick controlled manual operation without interruption of the flight. We are aware that other auto-leveled camera mounts lack this feature and that leveling failure requires that the mission be abandoned and the aircraft returned to base for repair.

We intend to invite you to an open house at our new facilities at Pitt Meadows airport as soon as the winter teardown of our two photo aircraft has been completed, and we will be pleased to show off our new camera mount at that time.

Kindest Regards,

Anna (GM)
Jim (Chief Pilot)
Paul (Aerial Operations Coordinator)
Parker, and
Bev
